

Supplementary Table 1. The performance of mSOFA and original SOFA scores for predicting mortality include population without serum bilirubin (n=1,900)

Variable	mSOFA	Original SOFA	P-value
All-cause in-hospital mortality	0.891 (0.876–0.906)	0.878 (0.863–0.893)	<0.001
All-cause ICU mortality	0.879 (0.876–0.906)	0.869 (0.853–0.885)	<0.001
All-cause 28-day mortality	0.898 (0.877–0.919)	0.884 (0.861–0.907)	<0.001

Values are presented as area under the receiver operating characteristic curve (95% confidence interval).

mSOFA: modified Sequential Organ Failure Assessment; ICU: intensive care unit.
